

**Video question script: Seismic evidence and potty putty mantle**

<b>Question/Activity</b>	<b>Likely response</b>	<b>Rationale</b>
An exploration of the evidence from seismic waves on how plate tectonics works. It uses the 'Bouncing, bending breaking' Earthlearningidea		A summary of the seismic evidence and its important for plate tectonics

<b>Seismic evidence</b>		
Explain: Seismic waves are shock waves ...		Concrete preparation: explanation of seismic wave properties
Explain: a graph of the speeds of seismic waves shows that: <ul style="list-style-type: none"> <li>• there are no S-waves between around 3000 and 5200km depth = liquid outer core</li> <li>• there are S-waves beneath this = solid inner core</li> <li>• the S-waves travel through the crust and mantle = solid</li> <li>• seismic waves slow down in the low velocity zone = plastic – can flow</li> </ul>		Concrete preparation: explanation of seismic wave graph in the context of previous information
Summarise: crust/ mantle boundary – nothing to do with plate tectonics; lithosphere/ asthenosphere boundary – lithosphere = plates; asthenosphere = weak sphere which can flow allowing plate movement		

<b>Solids that flow</b>												
Ask: Can anyone think of a common solid that flows?	<ul style="list-style-type: none"> <li>• ice</li> </ul>	Cognitive conflict: Which solids flow?										
Introduce silicone gel = 'potty putty'. Demonstrate: <ul style="list-style-type: none"> <li>• elastic behaviour = bouncing</li> <li>• plastic behaviour = bending, stretching or plastic flow</li> <li>• brittle behaviour = breaking</li> </ul>		Concrete preparation: investigation of 'potty putty' properties										
Ask: What's the difference? Why is it that sometimes the material bounces, sometimes it breaks and sometimes it flows?	<ul style="list-style-type: none"> <li>• the answer is 'time'; a short sharp shock causes it to break, pressure over a longer time causes bouncing, whilst pressure exerted over an even longer time causes flow</li> </ul>	Cognitive conflict: What's the difference?										
Ask: How are 'potty putty' and the mantle similar?	<table border="1"> <thead> <tr> <th><b>Potty Putty</b></th> <th><b>Mantle</b></th> </tr> </thead> <tbody> <tr> <td>bounces</td> <td>transmits S-waves</td> </tr> <tr> <td>breaks</td> <td>earthquakes</td> </tr> <tr> <td>bends</td> <td>flow over time</td> </tr> <tr> <td colspan="2">The difference is time – mantle flow is over geological time, with enormous temperatures and pressures</td> </tr> </tbody> </table>	<b>Potty Putty</b>	<b>Mantle</b>	bounces	transmits S-waves	breaks	earthquakes	bends	flow over time	The difference is time – mantle flow is over geological time, with enormous temperatures and pressures		Bridging: applying the properties of one material to another
<b>Potty Putty</b>	<b>Mantle</b>											
bounces	transmits S-waves											
breaks	earthquakes											
bends	flow over time											
The difference is time – mantle flow is over geological time, with enormous temperatures and pressures												

<b>Skateboard summary</b>		
Explain that a skateboard can be a simulation of the lithosphere/ asthenosphere	<ul style="list-style-type: none"> <li>• trainers = crust</li> <li>• skateboard = rigid extreme upper mantle</li> <li>• wheels = asthenosphere that can flow, allowing plate movement</li> <li>• tarmac = more rigid mantle below</li> </ul>	Bridging: between the skateboard and the Earth Consolidation
